

GRADE IIIC GEOGRAPHY TEACHER – WRITTEN INTERVIEW EXAMINATION

Instructions

- Answer all questions.
- Each question has four alternatives (A–D).
- Choose the **MOST accurate** answer based on geographical knowledge and teaching competence.

1.

A secondary school class is studying the formation of fold mountains. Which of the following explanations best integrates plate tectonic theory with observable classroom evidence and a practical demonstration activity?

- A. Fold mountains form where two oceanic plates converge and one subducts beneath the other; demonstrate by folding a layered sponge to show subduction and uplift.
- B. Fold mountains develop at divergent plate boundaries where tensional forces create uplift; demonstrate by stretching a rubber sheet to show uplift and folding.
- C. Fold mountains result from compressional forces at convergent continental plate margins causing crustal shortening and thickening; demonstrate by compressing layered clay to produce upright folds and axial planes.
- D. Fold mountains are produced by vertical mantle plumes pushing the crust upward; demonstrate by heating wax to show doming and subsequent folding.

Correct Answer:

C. Compressional forces at convergent continental margins best explains fold mountain formation; compressing layered clay reproduces crustal shortening and upright folds consistent with plate tectonic mechanisms.

2.

When teaching climatic classification to senior secondary students, which assessment task most effectively evaluates both conceptual understanding and application of the Köppen system to local planning issues?

- A. Ask students to memorise Köppen class codes and reproduce them in a written test.
- B. Require students to classify global climate graphs by Köppen type and justify implications for agricultural zoning in their district.
- C. Have students create a poster of world climate zones with decorative symbols and colours.
- D. Assign students to interview local farmers about weather observations.

Correct Answer:

B. Classifying climate graphs and linking them to agricultural zoning evaluates conceptual mastery and real-world application.

3.

A candidate is asked to teach map scale concepts to a mixed-ability class. Which instructional sequence most effectively scaffolds learning from concrete to abstract while assessing mastery?

- A. Present the scale formula then assign problems and a quiz.
- B. Begin with field measurement using pacing and tape, relate measurements to a classroom map, introduce representative fraction and graphic scale, then apply problem-solving.
- C. Show several maps and ask students to memorise scale differences.
- D. Use only digital mapping software zooming activities.

Correct Answer:

B. Field measurement linked to map representation provides concrete experience followed by conceptual abstraction and application

4.

Which classroom assessment item best measures a candidate teacher's ability to integrate human geography concepts with inquiry-based learning?

- A. Multiple-choice test on definitions of migration.
- B. Teacher-led lecture followed by a quiz.
- C. Student-designed migration survey with spatial analysis and policy recommendations.
- D. Chapter summary homework.

Correct Answer:

C. Inquiry projects involving data collection, mapping, and recommendations demonstrate higher-order geographic thinking

5.

Which explanation most accurately describes the role of soil texture in determining infiltration rates and how a teacher should demonstrate this practically?

- A. Soil texture is unrelated to infiltration.
- B. Coarse soils allow higher infiltration; demonstrate using sand, silt, and clay columns measuring percolation time.
- C. Clay soils always have higher infiltration.
- D. Organic matter alone controls infiltration.

Correct Answer:

B. Larger pore spaces in coarse soils increase infiltration and can be demonstrated through comparative soil column experiments.

6.

A geography teacher must explain carrying capacity in relation to sustainable land use. Which activity best develops application skills?

- A. Vocabulary lecture and test.
- B. Simulation allocating land uses and calculating sustainability thresholds.
- C. Essay on population growth.
- D. Documentary viewing only.

Correct Answer:

B. Simulation modelling promotes systems thinking and applied sustainability decision-making.

7.

Which map projection is most appropriate for a thematic population density map of an equatorial country?

- A. Mercator projection
- B. Equal-area projection
- C. Polar azimuthal projection
- D. Conformal projection

Correct Answer:

B. Equal-area projections preserve area relationships necessary for accurate density representation.

8.

In teaching river processes, which explanation best links geomorphology theory with a classroom experiment?

- A. Chemical dissolution only demonstration.
- B. Flume experiment showing erosion, transport, and deposition at varying flow velocities.
- C. Uniform channel deepening demonstration.
- D. Tidal influence experiment.

Correct Answer:

B. Flow velocity and sediment size determine fluvial processes and can be observed using a flume model.

9.

Which assessment most validly evaluates pedagogical content knowledge for population pyramids?

- A. Drawing pyramids from memory.
- B. Interpreting pyramids and designing lessons addressing misconceptions.
- C. Writing lecture notes.
- D. Listing causes of growth.

Correct Answer:

B. Interpretation plus lesson design demonstrates deep pedagogical content knowledge.

10.

Which approach best integrates climate change science with local adaptation strategies?

- A. Teaching climate models only.
- B. Combining greenhouse theory with local vulnerability assessment and adaptation planning.
- C. Studying historical weather only.
- D. Political debates only.

Correct Answer:

B. Linking scientific mechanisms with local adaptation fosters applied understanding.

11.

A candidate must teach urban land-use models. Which classroom task most effectively assesses students' ability to apply models to a rapidly growing secondary city?

- A. Memorise concentric zone, sector, and multiple nuclei models.
- B. Analyse local land-use maps, evaluate applicable models, and propose planning interventions.

- C. Watch an urbanisation video and answer questions.
- D. Create a collage of urban features.

Correct Answer:

B. Analysing spatial data and proposing interventions demonstrates application of theory to real urban contexts rather than memorisation.

12.

Which explanation most accurately describes the pedagogical advantage of GIS in teaching site selection?

- A. GIS has little value in secondary education.
- B. GIS enables spatial analysis of accessibility, hazards, and population distribution supporting inquiry-based decisions.
- C. GIS produces attractive maps only.
- D. GIS replaces traditional map skills.

Correct Answer:

B. GIS supports multi-criteria spatial analysis and inquiry learning while complementing traditional mapping skills.

13.

Which classroom strategy best addresses misconceptions about the water cycle?

- A. Copying a static diagram.
- B. Systems-thinking modelling with simulated environmental changes.
- C. Teaching evaporation and precipitation separately.
- D. Memorising definitions.

Correct Answer:

B. Systems modelling helps students understand interactions between components of the water cycle.

14.

Which examination question measures higher-order thinking about sustainable transport planning?

- A. Define public transport.
- B. Evaluate transport policies reducing congestion using environmental, social, and economic criteria.

- C. List transport types.
- D. Name a busy road.

Correct Answer:

B. Evaluation across multiple criteria requires analysis and synthesis beyond recall.

15.

Which experimental demonstration best shows formation of wave-cut platforms?

- A. Gentle water poured on sand.
- B. Coastal model with layered materials and simulated waves producing erosion and cliff retreat.
- C. Viewing photographs only.
- D. Wind erosion experiment.

Correct Answer:

B. Controlled wave simulation demonstrates erosion processes forming cliffs and platforms.

16.

Which assessment best evaluates differentiated instruction in a mixed-ability geography class?

- A. Same worksheet for all learners.
- B. Tiered activities with scaffolding and formative assessment checks.
- C. Teaching unrelated topics to ability groups.
- D. Independent work without guidance.

Correct Answer:

B. Tiered tasks maintain shared objectives while addressing varied learner needs.

17.

Which statement best explains lithology and slope stability assessment?

- A. All rocks are equally stable.
- B. Stability depends on lithology, structure, and hydrology analysed through landslide case studies.
- C. Vegetation alone controls stability.
- D. Stability is unpredictable.

Correct Answer:

B. Integrated geological and hydrological analysis supports hazard mitigation understanding.

18.

Which pedagogical approach improves interpretation of choropleth maps?

- A. Use arbitrary classifications without explanation.
- B. Teach classification rationale and require justification of chosen intervals.
- C. Avoid choropleth maps entirely.
- D. Remove legends from maps.

Correct Answer:

B. Understanding classification schemes prevents misinterpretation of spatial data.

19.

Which activity best integrates ecological principles with local agricultural realities?

- A. Farming lecture only.
- B. Field study analysing soils, farmer interviews, and sustainable intensification evaluation.
- C. Drawing farm animals.
- D. Watching documentaries only.

Correct Answer:

B. Field-based inquiry links ecological science with economic decision-making.

20.

Which method best teaches spatial interaction using gravity models?

- A. Algebraic formula memorisation.
- B. Apply simplified gravity model to predict school catchment flows and validate with enrolment data.
- C. Teach migration only.
- D. Random school assignments.

Correct Answer:

B. Application and validation develop conceptual and empirical understanding.

21.

Which intervention develops critical evaluation of geographic information sources?

- A. Accept all online maps as accurate.
- B. Compare multiple datasets using evaluation criteria such as authority and scale.

- C. Ban internet usage.
- D. Memorise one dataset.

Correct Answer:

B. Comparative evaluation builds digital geographic literacy.

22.

Which task best measures understanding of energy resources and regional development?

- A. Listing energy types.
- B. Comparative regional case study analysing economic, environmental, and policy impacts.
- C. Colouring oil fields.
- D. Memorising terminology.

Correct Answer:

B. Comparative analysis demonstrates integrated geographic reasoning.

23.

Which demonstration best illustrates isostasy?

- A. Static diagram.
- B. Foam model loaded with weights then released to simulate rebound.
- C. Dropping objects into water.
- D. Pendulum experiment.

Correct Answer:

B. Load and rebound modelling effectively demonstrates crustal adjustment processes.

24.

Which exam question best assesses synthesis of location theory with supply-chain issues?

- A. Define location theory.
- B. Analyse how transport costs, agglomeration, and digitalisation influence firm location decisions and propose policies.
- C. List firms.
- D. Describe industrial history only.

Correct Answer:

B. Applying theory to modern economic systems demonstrates synthesis and evaluation.

25.

Which instructional strategy best prepares students for topographic map route planning?

- A. Classroom contour exercises only.
- B. Combine classroom interpretation with supervised field navigation using compass and map.
- C. Use GPS only.
- D. Provide pre-planned routes.

Correct Answer:

B. Field application develops practical spatial decision-making skills.

26.

Which assessment best evaluates teaching of Sustainable Urban Drainage Systems (SUDS)?

- A. Memorise acronym.
- B. Design SUDS plan for school compound including runoff estimation and maintenance.
- C. View images only.
- D. Reading assignment only.

Correct Answer:

B. Design tasks assess applied hydrological and sustainability understanding

27.

Which explanation best justifies place-based inquiry in teaching cultural landscapes?

- A. Teach theory only.
- B. Engage students with local landscapes linking identity, culture, and spatial patterns.
- C. Avoid subjective topics.
- D. Use distant examples only.

Correct Answer:

B. Local inquiry promotes contextualised and meaningful geographic understanding

28.

Which assessment best measures interpretation of climatic data trends?

- A. Plot data, analyse trends, and recommend agricultural adaptations.
- B. Memorise rainfall averages.

- C. Identify graph colours.
- D. Recite definitions.

Correct Answer:

A. Data analysis linked to agricultural decisions evaluates applied climate literacy.

29.

Which teaching method best develops understanding of spatial inequality?

- A. Use national averages only.
- B. Map and statistically compare regional data followed by policy debate.
- C. Teach global inequality only.
- D. Use anecdotes without data.

Correct Answer:

B. Spatial analysis and debate reveal geographic variation and policy implications.

30.

Which summative assessment best evaluates learning outcomes for a natural hazards unit?

- A. Single multiple-choice test.
- B. Scenario-based risk assessment, map exercise, and rubric-assessed presentation.
- C. Ungraded discussion.
- D. Definition worksheet.

Correct Answer:

B. Mixed-method assessment ensures validity, reliability, and evaluation of multiple competencies.
